

Assignment 5th of User interface

1. Versions

a. Alpha

The software is complete enough for *internal* testing. This is typically done by people other than the software engineers who wrote it, but still within the same organization or community that developed the software.

b. Beta

The software is complete enough for *external* testing -- that is, by groups outside the organization or community that developed the software. Beta software is usually feature complete, but may have known limitations or bugs. Betas are either closed (private) and limited to a specific set of users, or they can be open to the general public.

2. Slicing the interface

- Analyze the interface structure
- Use layer guides to define containers
- Extract all images to correct format

Coding the homepage

- Create the containers structure (using colors and names)
- Integrate the interface elements
- Create the main navigation
- Test the interface
- Code the breakup point
- Code/adjust the mobile version

- Test the mobile homepage

3. Producing the alpha version

- Duplicate the section page as many times as needed + rename them (to get all the needed pages)
- Create content pages if needed
- Integrate the main title in each of the section and content pages
- Update the navigation
- Test the desktop and mobile versions (Alpha testing)
